be at about pH 6.22 Importantly, the surface P_{K_n} is a strong function of the electrode potential, varying over about 6 pH units within a potential range of ± 1 V versus EP, so the experimental value reported here is only correct at +0.2 V. At more positive potentials the surface P_{K_a} will shift to lower values, while at negative potentials

Determination Of Surface Pka Values Of Surface Confined

The determination of p Ka values of acids can be done in a multitude of manners, ranging from the classic potentiometric titration to computationally. We envisioned that it would be possible to determine the p Ka values of polyelectrolytes using surface tension measurements at the surface-to-air interface. When measuring surface tension at the surface-to-air interface of polyelectrolytes at differing solution

A simple and novel method is proposed here for the first time to determine pKa values of chromogenic hydrophobic pH sensitive probes directly in nanospheres. pKa values can be obtained by measuring the pH response of the nanospheres (containing the probes and ion exchanger) followed by measuring the pH and Na⁺ responses of the nanospheres (containing solvatochromic dyes and ion exchanger).

Determination of pKa Values of Hydrophobic Colorimetric pH ...

The pKa is the pH at which the system consists of an equimolar concentration of the proton donor (CH₃COOH) and proton acceptor (CH₃COO⁻). This relationship between pKa and pH and Buffer-action can be determined from the Henderson-Hasselbalch Equation that we have already discussed in the previous post.
