EMS stands for Engine Management System which consists of a wide range of electronic and electrical components such as sensors, relays, actuators, and an Engine Control Unit. They work together to provide the Engine Management System with vital data parameters. These are essential for governing various engine functions effectively. Furthermore, the Engine Management system is incorporated in the modern-day engine technologies.

At system initialization, the Intel® Management Engine loads its code from system flash memory. This allows the Intel® Management Engine to be up before the main operating system is started. For run-time data storage, the Intel® Management Engine has access to a protected area of system memory (in addition to a small amount of on-chip cache memory for faster and more efficient processing).
