With increased awareness about pharmacogenomics-based testing, patients may provide genetic information to their physicians to help inform drug product selection. In particular, direct-to-consumer companies have emerged that provide genotyping services for disease-risk and drug-response genes (34, 35). The information provided by these companies may allow consumers to require more personalized medical treatments from their physicians.

Pharmacogenomics is the study of how a patient's genome can influence how they respond to medicines. Variants in an individual's genome can increase the functioning of medicines or make them ineffective. They can also help predict which patients will suffer from side-effects - from the merely unpleasant to potentially life-threatening.
